

Week - 2 Seminar and Sprint Overview

- **Topic:** IEEE 830 + ISO/IEC/IEEE 29148 - Structures and Attributes (Format: Exercise).
- **Lecturer:** Ph.D. Batnyam Battulga, National University of Mongolia - Summer Semester 2026 (15-week course 'SW Project Documentation').
- **Sprint Goal:** An SRS template and Traceability Matrix for the main project have been created using the IEEE-830 table of contents and the eight ISO quality attributes. The scoping method from Chinchilla (Ch. 5, pp. 53-55) was applied to trim the template strictly to the project's scope ('just enough').

Product Backlog (User Stories)

Every user story follows the format 'As a [Role], I want [Desire], so that [Benefit]'. Acceptance criteria are formulated to be testable (Given-When-Then or observability lists), and the 'Literature Base' explicitly highlights the relevant book chapter, page, and core concept.

ID	User Story	Acceptance Criteria	Literature Base
US-2.1	As a student, I want to map the IEEE-830 sections to the main project and mark gaps with 'not applicable', so the template is complete without phantom sections.	Mapping table (Section x Content x Status) in the workspace. Exactly one status per section: complete / planned (W...) / n-a (justified). Single-sentence justifications for 'n-a'.	IEEE Std 830-1998. Bhatti Ch. 2, pp. 23-44 for scoping mentality.
US-2.2	As a student, I want to write five requirements conforming to IEEE/ISO-29148 (Functional/Non-Functional, ID, Priority, Verification) to link them with tests.	Requirements have Fr-XX or Nfr-XX IDs. Explicit priorities (must/shall/may) with no 'should'. Named verification methods (Test/Inspection/Analysis). Owner and source interview recorded.	ISO/IEC/IEEE 29148:2018, Para. 5.2. Bhatti Ch. 4, pp. 67-81.
US-2.3	As a student, I want to create an eight-column Traceability Matrix (ID, Source, Owner, Verification, Dependency, Risk, Status, Last-Reviewed) and link all FR/NFRs to enable seamless future audits (W13).	Table stored in Confluence 'Requirements' area. Every requirement has a row with at least three filled columns. At least one requirement traces back to a W1 Persona pain point (Bhatti contract).	Bhatti Ch. 9, pp. 147-167 for audit prep. Macnamara et al. 'Do Docs Better' for tracking.

Exercises and Agile Ceremonies

Definition of Done & Mandatory Exercise (UE-2 / 90 Min)

- **DoD:** SRS-Template published, five uniquely testable requirements written, Traceability-Matrix completed with persona links, and Peer-Review-Draft sent to a neighboring team.
- **Exercise:** Anchor the sprint work in Bhatti et al. (2021) and/or Chinchilla (2024) by applying Chinchilla's scoping reflection questions to your project. The deliverable is a 1-page 'SRS-Scope-Charter' detailing included features, excluded features (with justifications), and postponed features. This charter is a prerequisite for M3-SRS in W3.

Agile Ceremonies

- **Daily Standup:** Which IEEE section did I map today? How many requirements are in traceability (Target: >= 3)? Which W1 persona pain point am I missing as a source?.
- **Sprint Retrospective:** What went well (Stub-Mapping-Table)? What was unclear (SRS vs. SDD distinction)? What will I change in the workflow?.

References and Reflection

- **Core Reading:** Bhatti Ch. 2 & 4; Chinchilla Ch. 2 & 5; IEEE Std 830-1998; ISO/IEC/IEEE 29148:2018.
- **Reflections:** Which concept from Bhatti challenged my previous documentation practice the most? Which concept from Chinchilla will I continue to use in W16+? Where do I see the greatest discrepancy between 'what the books say' and 'what we actually practice'?

(Note: Document status is 2026-08-30, requiring 90 min lecture + 90 min exercise, M-Number binding for grading.)
