

NATIONAL UNIVERSITY OF MONGOLIA

Department of Computer Science | SW Project Documentation (Summer Semester 2026)

Instructor: Ph.D. Batnyam Battulga | **Assignment Sheet:** Week 03 (Sprint M3) |

Timeframe: 90 Min Lecture + 90 Min Lab/Exercise

SPRINT GOAL & CORE REQUIREMENT

A complete SRS v1.0 with 20 requirements (15 FR + 5 NFR) must be published in the workspace. Every requirement applies the "State your most important information first" rule (Bhatti Ch. 3 p. 58). The Human-vs-AI comparison documents at least three AI errors corrected prior to publishing.

METRIC / SPRINT GOAL	QUANTITY / SPECIFICATION	LITERATURE BASE & FOCUS
Functional Requirements (FR)	15 complete FRs with test procedure	Bhatti Ch. 3 (pp. 45–66)
Non-Functional Requirements (NFR)	5 measurable NFRs from ≥3 categories	Chinchilla Ch. 7 (pp. 87–104)
Use-Verify-Cite Audit	3 AI discrepancies logged	Bhatti Ch. 5 / Chinchilla Ch. 9
Peer-Review Loop	v0.9 → v1.0 (3 comments addressed)	Bhatti Ch. 4 (p. 79) / Ch. 8

BACKLOG: USER STORIES & ACCEPTANCE CRITERIA

US-3.1: 15 Functional Requirements (FR)

- **User Story:** As a student, I want to fully formulate 15 functional requirements, each with a test procedure and mock UI screenshot, so that the SRS has a realistic contractual interface.
- **Acceptance Criteria:**
 - Each FR contains its own test procedure in the traceability entry.
 - At least 5 FRs have a mock UI screenshot as an acceptance criterion.
 - Priority order (must > should > could) is activated in the template.
- **Literature Base:** Bhatti Ch. 3 p. 58 ("State most important info first") & p. 59 ("Break up large blocks of text").

US-3.2: 5 Non-Functional Requirements (NFR)

- **User Story:** As a student, I want to add five non-functional requirements from at least three categories (Performance, Security, Reliability, Maintainability, Accessibility), each with a measurable boundary, so that NFRs do not turn into a catch-all bucket.
- **Acceptance Criteria:**
 - Each NFR has a measurable boundary (e.g., < 500 ms p95).
 - Test method explicitly named for each NFR.
 - At least one boundary originates from at least two reference sources (Stripe, Apache, Akamai).
- **Literature Base:** Chinchilla Ch. 7 p. 97 ("Making images accessible").

US-3.3: Use-Verify-Cite AI Comparison (GPT-4 Benchmarking)

- **User Story:** As a student, I want to compare a GPT-4-generated SRS candidate against my draft SRS (Use-Verify-Cite workflow), so that the line between generative assistance and human specification becomes clear.
- **Acceptance Criteria:**
 - Three differences documented (e.g., missing boundary, ambiguity, NFR drift).
 - For each difference, AI quote and proposed correction included.

- Comparison formatted as a wiki entry (not left in chat).
- **Literature Base:** Bhatti Ch. 5 pp. 96–98, Chinchilla Ch. 9 p. 123 ("Generating documentation") & p. 130.

US-3.4: Peer Review & Versioning (v0.9 → v1.0)

- **User Story:** As a student, I want to have my SRS reviewed once by a peer team and incorporate feedback, so that the SRS is documented in two versions (v0.9 and v1.0).
- **Acceptance Criteria:**
 - Peer team comments recorded as Confluence comments.
 - At least three review comments addressed with justification.
 - Diff between v0.9 and v1.0 documented in the traceability appendix.
- **Literature Base:** Bhatti Ch. 4 p. 79 ("Giving good feedback") & Bhatti Ch. 8 pp. 133–146.

MANDATORY ADDITIONAL EXERCISE (UE-3: 120 MIN)

- **Scenario:** Take the Corg.ly scenario from Bhatti Ch. 3 (Charlotte writing Getting Started for Pet Translation API).
- **Task 1:** Write 5 FRs in Bhatti's "State-most-important-info-first" style (p. 58): each FR block starts directly with the result, not the verification logic.
- **Task 2:** Request an alternative formulation from GPT-4/Claude. Log three instances where the AI violates Bhatti's "Concise" (Ch. 5 p. 90) or "Usable" (Ch. 5 p. 93) principles.
- **Submission:** Requirement diff plus a 1-page reflection note.

DEFINITION OF DONE & AGILE RITUALS

Definition of Done (DoD)

- [] SRS v1.0 published in the workspace.
- [] Human-vs-AI comparison table uploaded.
- [] Peer review documented (at least 3 comments addressed).
- [] At least 80% of requirements confirmed in trial tests.

- [] M3 mandatory milestone reached.

Daily Standup

1. How many FR/NFR did I write today (Target: 3 + 1)?
2. Have I adjusted the AI prompts from the workshop?
3. Where is the biggest gap (Pass/Fail boundary, test requirements)?

Sprint Retrospective

1. Which review comments were substantively relevant?
2. Which Use-Verify-Cite steps proved effective?
3. What will I change in the next sprint (earlier peer reviews)?

REQUIRED READING & REFLECTION

- Bhatti et al.: *Docs for Developers* (Apress 2021), Ch. 3 (pp. 45–66), Ch. 4 (pp. 67–81).
- Chinchilla: *Technical Writing for Software Developers* (Packt 2024), Ch. 5 (pp. 53–63), Ch. 9 (pp. 119–131).

Written Reflection Questions:

1. Which concept from Bhatti challenged your previous documentation practice the most (specify page number)?
2. Which concept from Chinchilla will you continue to apply in W16+ (specify page number)?
3. At what point in the main project do you see the largest discrepancy between "what the books say" and "what we actually practice"?
